

GumBall6900

The index fund that chooses itself

Designed for a fair launch: anyone can **mine GBX** through the Fundraiser, then signal which assets should receive the next dollar.

START HERE

The next dollar follows the signal

Traditional indices are assembled for investors. GumBall6900 lets holders continuously direct where newly arriving capital goes - without turning signaling into conventional governance.

TRADITIONAL INDEX

A small group decides what belongs.

- 1 A committee sets membership.
- 2 Periodic reviews change weights.
- 3 Investors accept the published basket.

Useful - but the selection process lives above the investor.

GUMBALL6900

Holders continuously signal where new capital should go.

- 1 Eligible Strategies are admitted.
- 2 SignalGBX points toward them.
- 3 Resonance routes the next USDG.

The result is holder-directed formation, not conventional governance.

THE KEY DISTINCTION

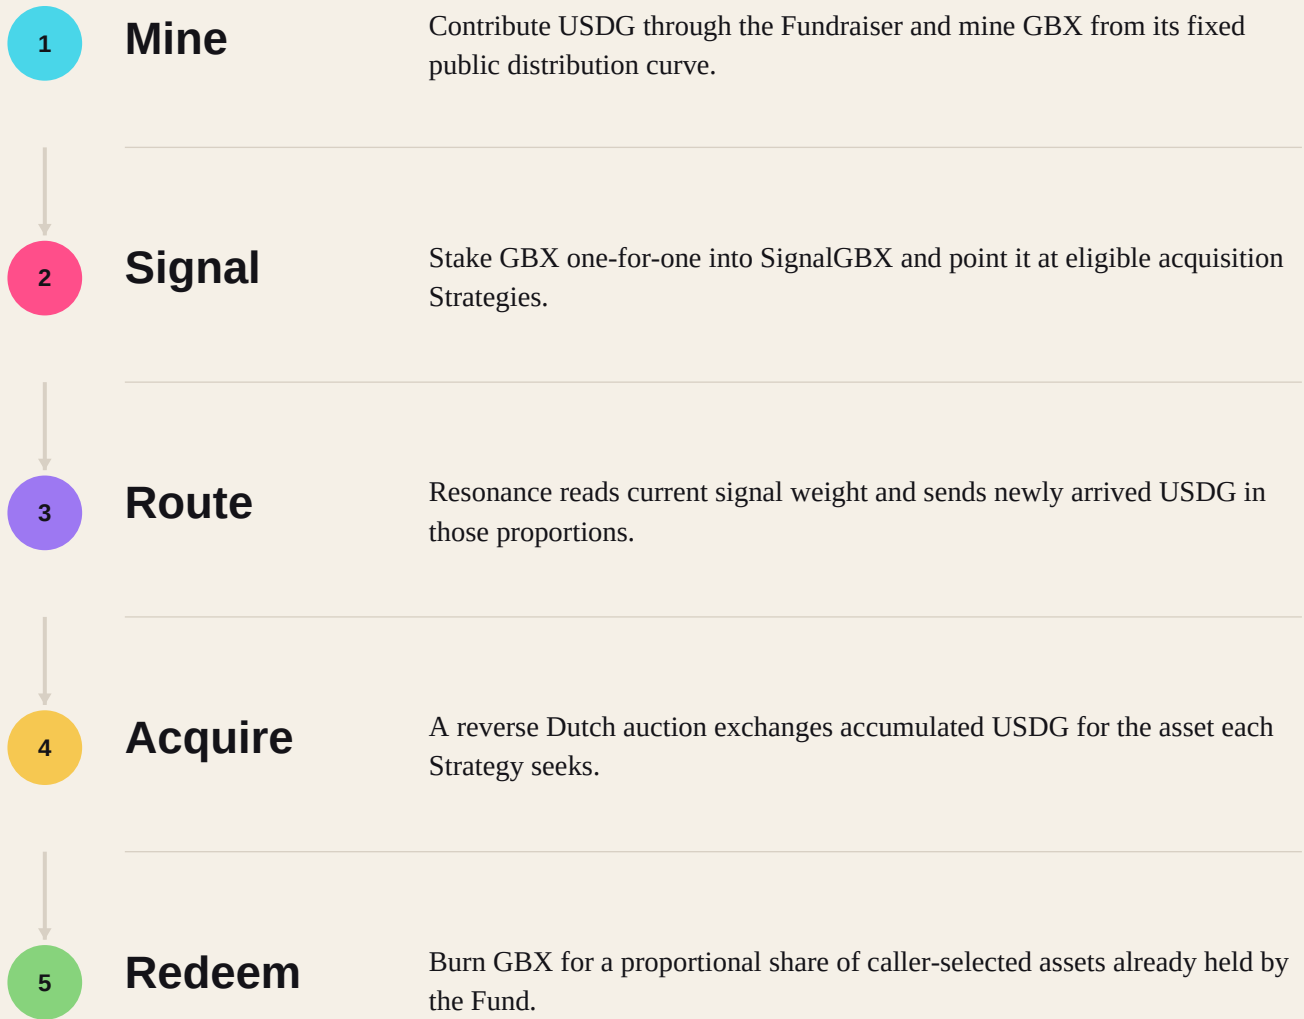

Signals steer future flow.

They do not automatically sell yesterday's holdings or rebalance the Fund. Every contribution is a new chance for the collective preference to express itself.

FIVE MOVES

The whole idea on one page

Public Fundraiser mining creates GBX; live holder signals direct where the protocol's next acquisitions go.

No proposal season. No fixed signaling epoch. No withdrawal lock after signals are cleared.

Six pieces, one shared machine

Each contract does a narrow job. The small boundaries make the money flow easier to inspect and reason about.

USDG

The stable asset contributed to the protocol and routed toward acquisitions.

GBX

The transferable token: a lifetime-limited claim plus the input for signaling.

SignalGBX

Non-transferable, staked GBX that measures an account's current signal weight.

Strategy

One eligible destination for USDG - normally a reverse Dutch acquisition.

Resonance

The allocation engine that reads signals and distributes newly received USDG.

Fund

The raw-token treasury that holds acquired assets and supports in-kind redemption.

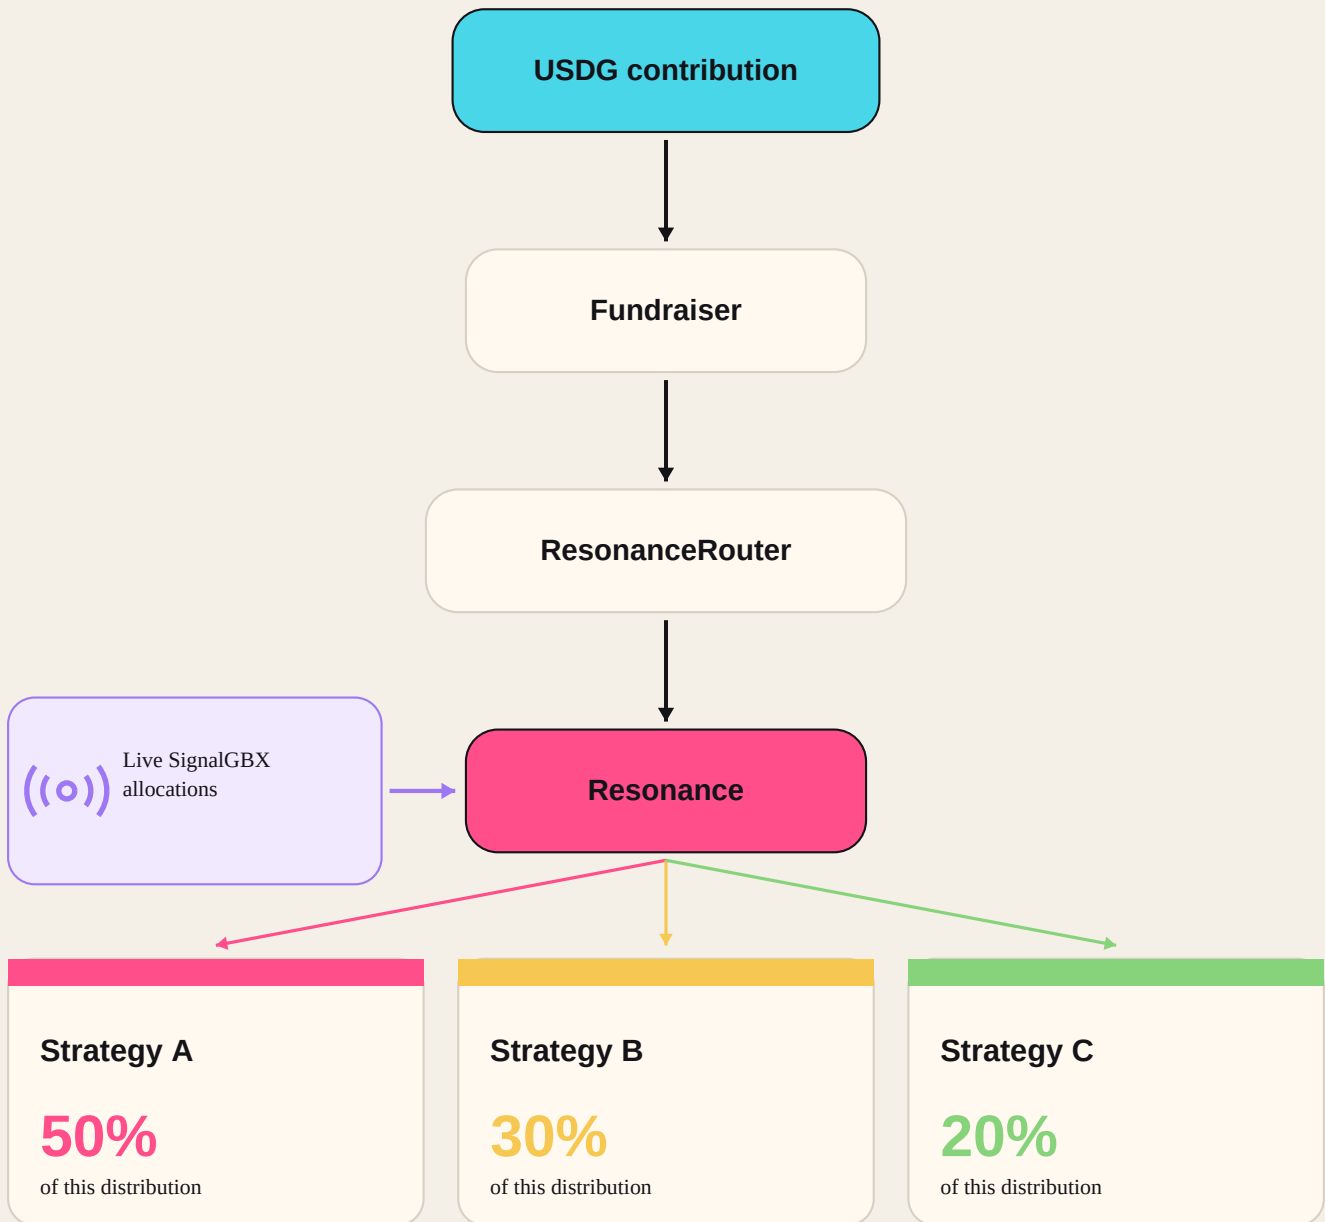

Technical note

ResonanceRouter is the permissionless intake pipe; Resonance is the allocation engine. Keeping the router separate makes delayed revenue easy to forward without granting anyone custody discretion.

ONE CONTRIBUTION

Follow the next dollar

This is the normal revenue path. Signal weight matters when Resonance distributes newly received USDG.

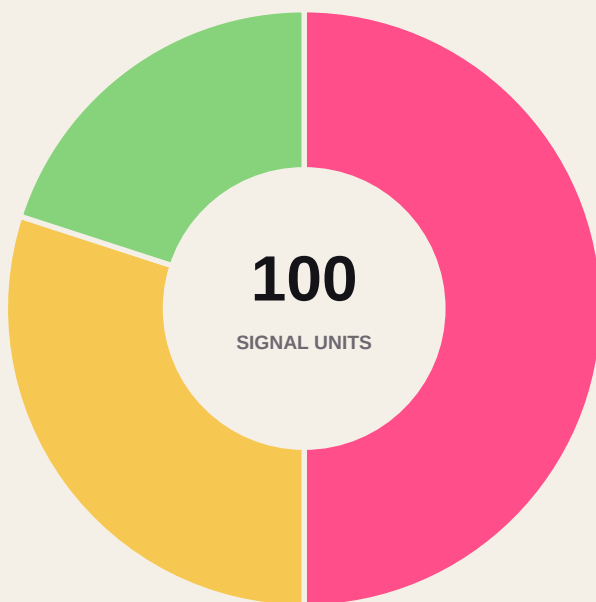

Illustrative weights only

The split can change before the next distribution because signaling is continuous.

THE HUMAN ACTION

A signal is a live allocation dial

People do not cast proposal ballots. They express where they want the protocol's next deployable dollars to lean.

50% Strategy A

30% Strategy B

20% Strategy C

Change your mind?

Replace or reset allocations at any time. After clearing signals, the underlying staked GBX can be withdrawn.

NO COOLDOWN

Signals can change whenever preference changes.

NO EPOCH BALLOT

There is no once-per-period allocation rule.

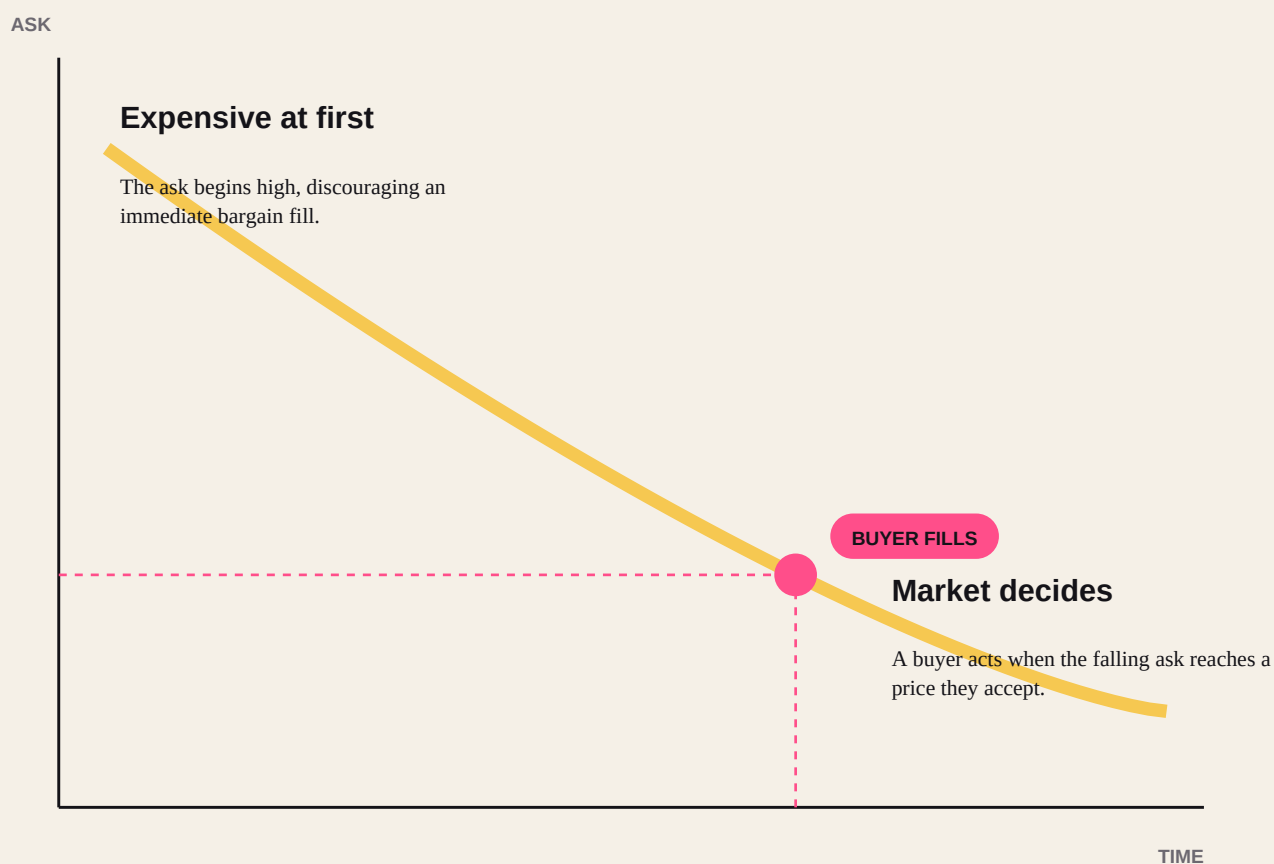

NO TRANSFER

SignalGBX itself cannot be traded.

PRICE DISCOVERY

The asking price falls until someone acts

A normal Strategy runs a bounded reverse Dutch auction. It offers its USDG pot in exchange for a target asset.

**Strategy's USDG**

goes to buyer

ATOMIC SWAP

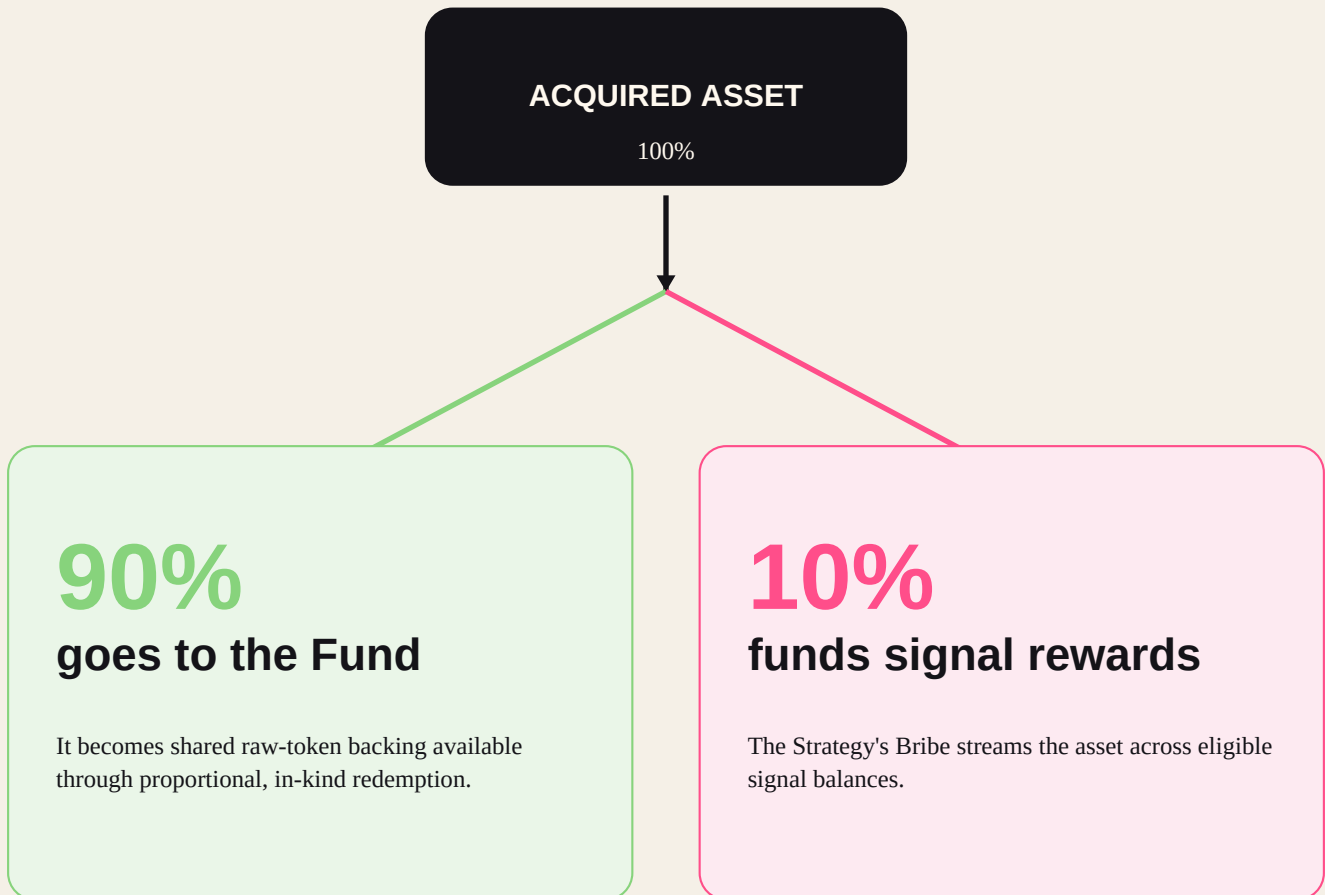

Target asset

enters protocol flow

WHERE IT LANDS

Most builds backing; some rewards the signal

When an acquisition clears, the target asset follows a transparent split.

GUARDRAILS

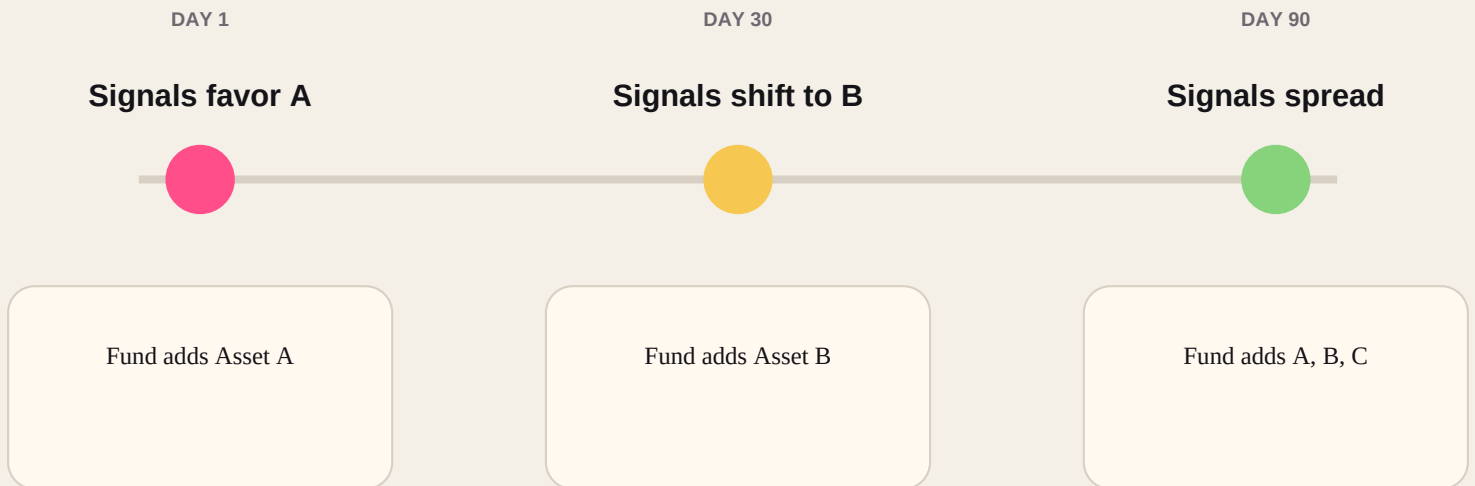

The initial reward share is 10%.

Timelocked governance may change it, but never above 50%. If nobody is eligible for rewards, that share returns to the Fund.

OVER TIME

The Fund remembers; the signal can move

Current signals decide where the next revenue goes. Existing holdings remain until redemption, migration, or market mechanics change them.

NO FORCED REBALANCE

A changed signal redirects future USDG; it does not order the Fund to sell what it already owns.

That makes GumBall6900 path-dependent: its history of contributions, signals, and completed acquisitions shapes today's basket.

THE CLAIM

Burn GBX, choose assets, receive your share

Redemption is in kind. The caller lists the Fund assets they actually want to claim.

PAYOUT FOR EACH SELECTED ASSET

$$\text{floor}(\text{Fund balance} \times \text{GBX burned} / \text{GBX supply before burn})$$

A simple example

YOU BURN

1,000 GBX

SUPPLY BEFORE

100,000 GBX

YOUR FRACTION

1%

If the Fund holds 50,000 Asset X and 8,000 Asset Y...

Selecting both returns 500 X and 80 Y, subject to integer flooring. Selecting only X returns 500 X; the omitted Y claim is permanently left for the remaining GBX supply.

Safety properties

Snapshots happen before the burn. The burn and all selected transfers are atomic. A failed selected-token transfer reverts everything.

HARD CEILING

One billion means one billion

GBX will be publicly mined through the Fundraiser. No team or private-sale allocation is reserved.

20M genesis liquidity

980M public mining

2%

98%

1,000,000,000 GBX

cumulative lifetime maximum

FAIR-LAUNCH MINING

Contributors mine GBX through the Fundraiser's fixed onchain schedule.

There is no reserved team, founder, investor, presale, or advisor allocation. The 20M genesis tranche is committed only to canonical liquidity; the remaining 980M can be mined through the Fundraiser. Here, mining means contributing USDG - not proof-of-work.

BURNS REDUCE OUTSTANDING SUPPLY - THEY DO NOT EXPAND FUTURE MINTING

SECONDARY LOOPS

Fees and buybacks reduce GBX supply

The canonical liquidity position and buyback Strategies reinforce the system without creating a separate governance machine.

CANONICAL GBX / USDG POSITION

Anyone may collect fees without removing principal.

GBX fees

burned permanently

USDG fees

ResonanceRouter -> Resonance

BUYBACK STRATEGY

USDG buys GBX; received GBX is burned atomically.

Buybacks do not pay signal rewards. They exchange protocol-directed USDG for GBX and destroy the GBX in the same transaction, so it never accumulates as idle treasury inventory.

TWO DIFFERENT JOBS

Holders signal. The timelock sets boundaries.

Keeping these roles separate is the point of the Resonance vocabulary.

HOLDER SIGNALS

Direct current flow

- Allocate SignalGBX among eligible Strategies.
- Replace or reset allocations at any time.
- Shape only future revenue distributions.

No proposal queue or ballot period.

TIMELOCKED ADMIN

Define safe rails

- Create or permanently disable Strategies.
- Set the reward share within its hard cap.
- Commit constrained successor migrations.

Delayed, narrow, and unable to withdraw Fund assets arbitrarily.

RESONANCE IS NOT A PARLIAMENT

It is a live capital-routing mechanism inside a deliberately small administrative perimeter.

THE EXPERIMENT

Asset inclusion becomes an open competition

Once a Strategy is admitted, communities can attract holder signal and buyers can decide when an acquisition price is acceptable.

The wager

Transparent incentives and continuous expression may produce a more adaptive basket than occasional, all-or-nothing governance decisions.

READ BEFORE ROMANCE

Onchain does not mean risk-free

The design removes some intermediaries, but it introduces smart-contract, market, asset, and governance-boundary risks.

SMART CONTRACTS

A coding flaw could break routing, rewards, auctions, burns, or redemption.

ASSET QUALITY

The Fund is permissionless raw-token custody; unwanted or broken tokens may arrive.

SIGNAL CONCENTRATION

Large SignalGBX holders may direct a disproportionate share of future capital.

MARKET EXECUTION

Auctions depend on buyers, liquidity, token behavior, and acceptable pricing.

SELECTIVE REDEMPTION

Omitted claims are forfeited; selecting a broken token can revert the whole call.

ADMIN BOUNDARIES

Timelocked powers are narrow, not nonexistent; successor commitments matter.

STATUS: PRE-AUDIT DEVELOPMENT STARTING POINT - NOT DEPLOYED - NOT AUTHORIZED FOR USER FUNDS

THE SHORT VERSION

A claim on the basket. A compass for what comes next.

GumBall6900 separates ownership from direction. GBX can be burned for a proportional in-kind claim on selected Fund assets. SignalGBX continuously points newly arriving capital toward eligible Strategies. Resonance turns that signal into flow.

**CLAIM**

GBX redemption relates to assets already in the Fund.

**COMPASS**

SignalGBX shapes future allocation, not past holdings.

**RAILS**

The timelock admits Strategies and enforces narrow limits.

GLOSSARY

GBX - transferable protocol token. **SignalGBX** - staked, non-transferable signal weight.
ResonanceRouter - intake pipe for USDG. **Resonance** - allocation engine.
Strategy - an eligible acquisition or buyback path. **Fund** - raw-token treasury.
